OBSERVATORY

Gemini Queue Operation

From Phase I to Archive

OPD, SOAR, Gemini – Brazil
2010-03-09

- Proposal preparation and submission – Phase I Tool
- Queue Construction – TAC/ITAC process
- Programme Definition – Observing Tool, NGO/Contact Scientist checks
- Programme execution – queue coordinator and staff observer
- Data distribution – data quality checks and Gemini Science Archive

Phase I process

- Phasel Tool

- Science justification
- Instrument configuration
- Target list
- Technical Justification
 - ObsTime and Conditions are proxy for the actual metrics (S/N, depth, etc) □ integrating for the requested time under the requested conditions will result in the requested metrics.
 - Observing time and worse possible condition constraints so the data will achieve proposed science goals
 - But... what do these condition constraints really mean?

Observing Constraints

- There are four observing constraints:
 - Cloud cover (sky transparency)
 - Image quality (delivered EED)
 - Sky background
 - Water vapour content (sky transparency)
- Must also consider **airmass** (zenith distance) as it affects some of the above.
- Some of those are wavelength dependent (eg water vapour content).
- Given in percentiles: IQ = 20%, 70%, 85%, Any
CC = 50%, 70%, 90%, Any
SB, WV = 20%, 50%, 80%, Any

Observing Constraints

Image Quality (non-AO) - MK and CP

Cloud Cover

- **CC=50%** – photometric or cloudless □ stable flux (usually monitored using the guide star counts).
- **CC=70%** – patchy clouds. Transparent patches among thicker clouds and/or thin cirrus □ variable flux, loss of transmission by 0.3mag relative to nominal extinction. In practice, 25% flux variation.
- **CC=90%** – cloudy. All sky covered with clouds, transmission poorer by 2mag relative to nominal, and variable. Stable guiding may be difficult. Background too high for thermal IR.
- **Any** – whatever else while we can still guide. For the ITCs, 3mag loss of transmission relative to nominal.

Image Quality

- Values are for the telescope pointing at zenith. So, 70% of the time the $IQ=0.8''$ or better in I-band at zenith.
- But if the target is at $AM=1.5$, delivered image quality for 70% is $IQ=1.02''$ or better
- Performance degradation is taken into account in the ITCs as a dependence of wavelength and airmass
- In the mid-IR, bins are defined as percent of the time IQ is within 10/20/50% of the diffraction limit at $10\mu m$.
- If programme requires absolute image quality, remember to take into account the elevation when selecting the IQ bin or request an elevation constraint.

Water Vapour

- Sky transparency in thermal IR (L,M and mid-IR).
- Atmospheric absorption is strongly wavelength dependent.
- ITCs use model transmission spectra with 0.04nm resolution.
- Not relevant in the optical!
- In the near-IR (JHK) only relevant between bands in lower resolution or if feature of interest near strong H₂O band in higher resolution

Sky Background

- In the optical, created by moonlight and zodiacal light.
- In the near-IR, by OH airglow and thermal background emission. It is colour dependent, but assumed constant.
- Only relevant for optical observations.
- roughly speaking, Moon is below the horizon half the time in queue mode. Thus SB=50 is dark time.
- for queue scheduling purposes, the computed background on a given night takes into account relative position of target to the Moon, and the Moon phase.

Phase I Constraints

- Airmass restrictions must be clearly stated in Phase I or will require approval from the corresponding site Head of Science Operations.
- **Airmass/Elevation constraints are used to preserve delivered IQ or reduce atmospheric diffraction effects.**
- Improving constraint bins also require approval.
Relaxing constraints do not (check your science!)
- Classical programmes with restrictive conditions are required to submit a backup programme and targets in case of poorer conditions, or time reverts to queue.
- Guide star brightness must be appropriate for conditions.

Time Allocation

- Proposal preparation and submission – Phase I Tool
- Queue Construction – TAC/ITAC process
- Programme Definition – Observing Tool, NGO/Contact Scientist checks
- Programme execution – queue coordinator and staff observer
- Data distribution – data quality checks and Gemini Science Archive

Time Allocation

- National TACs review all submitted proposals for technical feasibility, then grade on science merit.
- The graded list is passed to the International TAC.
- ITAC “merges” the queue:
 - merging sequence: one programme per partner for a default of three hours (adjusted by imbalance)
 - cycle through the sequence as many times as needed until all time for each partner is allocated
 - available time for each condition constraint is updated after each allocation. When a bin runs out of time, all subsequent programmes requiring that constraint are skipped.

Gemini North Science Observations: Average GN-2006B-2008B

- Proposal preparation and submission – Phase I Tool
- Queue Construction – TAC/ITAC process
- Programme Definition – Observing Tool, NGO/Contact Scientist checks
- Programme execution – queue coordinator and staff observer
- Data distribution – data quality checks and Gemini Science Archive

Phase II begins

- Defining the observations: Observing Tool
- Observing constraints in the OT are the ones used to create the nightly plans/evaluate observability/ do the data quality assesment.
- Timing and elevation constraints can be defined for each separate observation.
- Observations are executed with minimal intervention by the observer:
 - instrument configuration and changes, offsets, calibrations within the sequence, exposure times are all read from the OT sequence and passed by software to instrument and telescope.

Phase II process

- Very important to setup the programme correctly, so you get what you want, not just what you asked for.
 - Observations start at “Phase II”, where the user can modify as needed
 - When set to For Review and stored, NGO is notified and will do the first round of checking.
 - After some more interaction with user if needed, observations are set to For Activation and stored.
 - Gemini Contact Scientist is notified and will do the second round of checking.
 - After repeating the process as needed, observations are set to Ready and made available to be scheduled in the queue.

Phase II Changes

- Once an observation is set to “Ready” it cannot be modified by the PI or NGO.
- However, no observation is totally frozen:
 - Minor changes (small changes in central wavelength, exposure times, filters) can be done by contacting the Gemini CS and the NGO so the programme can be set back to Phase II
 - Major changes (improving condition constraints, change of targets) need approval by the Head of SciOps of the respective site.
- Programme can be fetched at any time from Observing Database to check on progress.

reinserted in the queue within the same band
as originally.

- Proposal preparation and submission – Phase I Tool
- Queue Construction – TAC/ITAC process
- Programme Definition – Observing Tool, NGO/Contact Scientist checks
- Programme execution – queue coordinator and staff observer
- Data distribution – data quality checks and Gemini Science Archive

Queue execution

- All “Ready” observations are available from the observing database.
- Each observation has a weight defined by the SRB, observability window, PI priority, programme status (started or not), target of opportunity, etc.
- Completion rate requirements and goals endorsed by the Gemini Board and the Operations Working Group
- Focus on high completion of Band 1 & 2 programs
- Focus on delivery of useful datasets:
 - Complete started Band 2
 - Reach PI min or complete started Band 3

Completion rates

➤ Requirements

- Band 1: 90% completion rate after rollover period
- Band 2: 75% completion rate
- Band 2: 85% of started programs should have 75% of data taken
- Band 3: 80% of started programs should have 75% of PI defined minimum data taken

➤ Goals

- Band 1: 100% completion rate after rollover period
- Band 2: 90% completion rate
- Band 2: 100% of started programs should have 75% of data taken
- Band 3: 80% of started programs should have 100% of PI defined minimum data taken
- Band 3: 80% of started programs should have 75% of all data taken

Photometric, Poor Seeing, Wet : CC50 IQ85 WVA

SB = unconstrained / CC = 50 / IQ = 85 / WV = any

F

Patchy Clouds/Thin Cirrus, Good Seeing, Wet : CC70 IQ70 WVA

SB = unconstrained / CC = 70 / IQ = 70 / WV = any

OPD, SOAR, Gemini –
Brazil 2010-03-09

- Staff observer every night, even during classical runs (revert to queue if conditions not appropriate and no backup programme defined).
- All available instruments may be scheduled during any single night.
- Change between instruments takes a couple of minutes.
- Rapid response for Target of Opportunity.
- Standard set of calibrations defined with the programme, and taken as part of observation or at the end of the night.

Classical by user choice is on average 9.1%

- Proposal preparation and submission – Phase I Tool
- Queue Construction – TAC/ITAC process
- Programme Definition – Observing Tool, NGO/Contact Scientist checks
- Programme execution – queue coordinator and staff observer
- Data distribution – data quality checks and Gemini Science Archive

Quality Assessment

- By the observer during the night: inspection of calibrations (saturation/faint arcs and flats), check of data integrity, monitoring of weather conditions (seeing, cloud cover, sky background, water vapour).
- By the Data Analyst Specialist the next day: check instrument configuration, check IQ from the data when possible, check flux level when possible (CC). Check calibrations and request repeat of any that may be missing.
- Processing of GMOS pre-imaging – distributed to users for mask design.
- No general processing to check for achieved S/N.

Data Distribution

- “Raw” (not QA-ed) data are transferred to the Archive in real-time (as observation progresses).
- Transfer time varies between 2–10min (dependent on transfer speed between sites and CADC in Canada)
- Once data checked and properly flagged as PASS (charged) or USABLE (not charged), are re-transferred to the Archive with updated headers.
- Pre-imaging also distributed from the Archive, and users notified by e-mail.
- Once a week, new data are “packaged” and a notification sent to the Principal Contact.

GEMINI
OBSERVATORY

The Gemini Science Archive

OPD, SOAR, Gemini – Brazil
2010-03-09

Introduction

- Hosted by CADC in Victoria, Canada.
- Released September 2004
- Gemini North data from May 2000
- Gemini South data from October 2001
- E-transfer started October 2005 – automatic transfer from sites to CADC.
- Active transfer from sites to archive as observation progresses.

Proprietary	0	1	181	617	1,042	1,345	788
Total	2	23	303	749	1,617	2,544	1,739

* As of Dec09

Data Distribution

During 2009

- 451 distinct users
- 920 registered users from 31 countries
- Average delivery ~9Gb/day

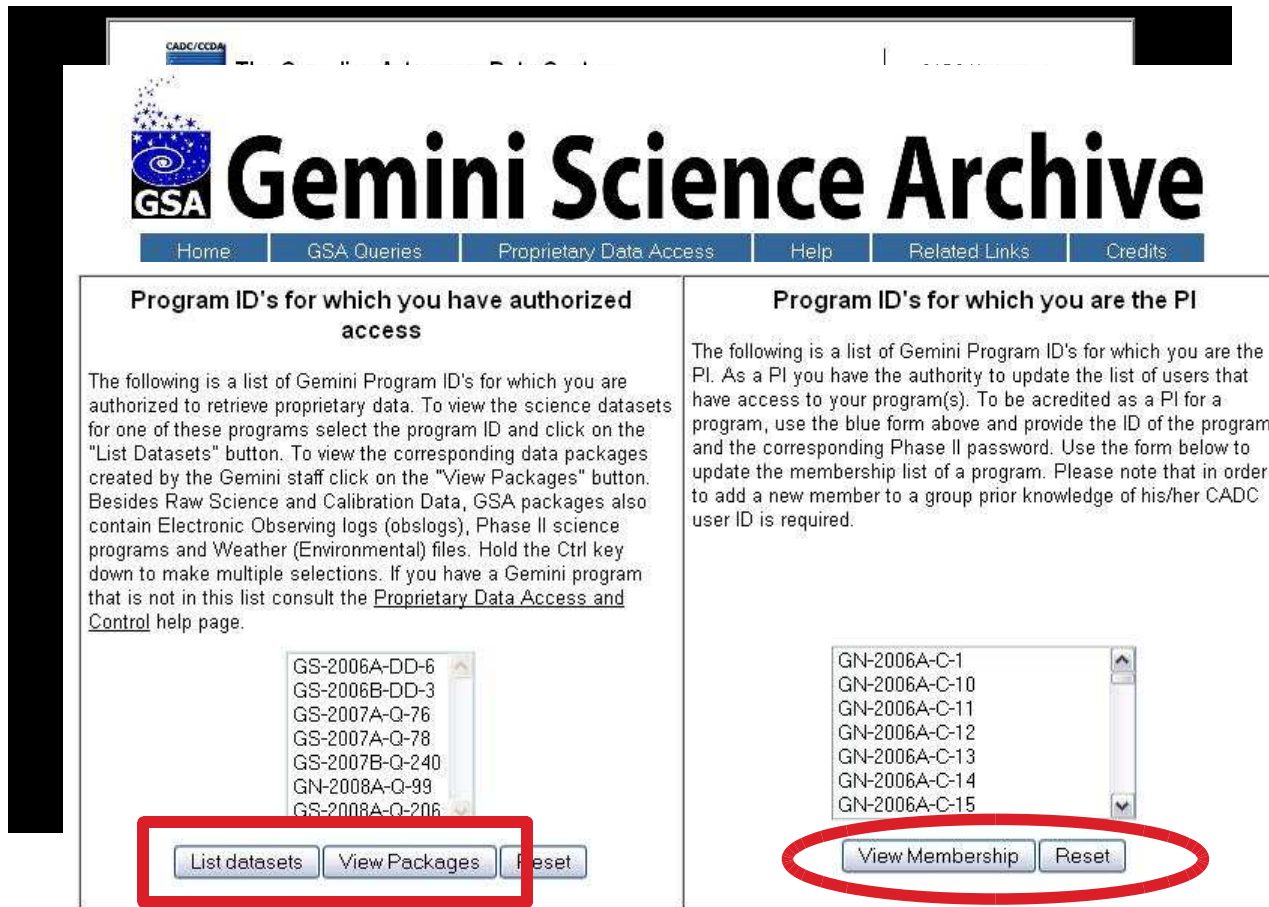

OPD, SOAR, Gemini –
Brazil 2010-03-09

Populating the database

- Database is populated with content of header keywords
- Header content is enforced from the time of ingestion – if a mandatory keyword is absent, the dataset is rejected until fixed
- Metadata related to individual observations is obtained from the Observing Tool – very little information is required to be added by the observer (environmental information in terms of realized percentiles, name of observer/SSA).
- Instrument/telescope related information is passed directly from subsystems to Data Handling System
- Result in complete, stable header content.
- Filename format is fixed and unique (S20100310S0001.fits)
- Each dataset is uniquely identified by a datalabel, containing the name of the programme (GN-2010A-Q-1-1-0001)
- Obslogs are automatically generated as observation progresses, and the observer can add comments, but not change content.

- Proprietary period 18 months from date of observation
- CADC registration required
- Access through Phase II passkey
- Authorize other users without releasing Phase II key
- Download datasets any time or “packages” when available

Program ID's for which you have authorized access

The following is a list of Gemini Program ID's for which you are authorized to retrieve proprietary data. To view the science datasets for one of these programs select the program ID and click on the "List Datasets" button. To view the corresponding data packages created by the Gemini staff click on the "View Packages" button. Besides Raw Science and Calibration Data, GSA packages also contain Electronic Observing logs (obslogs), Phase II science programs and Weather (Environmental) files. Hold the Ctrl key down to make multiple selections. If you have a Gemini program that is not in this list consult the [Proprietary Data Access and Control](#) help page.

Future possibilities for science usage

The screenshot shows the Gemini Science Archive (GSA) website. At the top, it identifies the site as part of the Canadian Astronomy Data Centre (CADC/CCDA) at the Herzberg Institute of Astrophysics. The main heading is "Gemini Science Archive". Below this is a navigation bar with links: Home, GSA Queries, Proprietary Data Access, Help, Related Links, and Credits. A dropdown menu is open under "GSA Queries", listing options: Search for Science Data, Search Complete Catalogue, Search for Processed Calibrations, Search Science Programs, Search Observing Logs, Find Weather Images, and Search Gemini Publications. The "Search Gemini Publications" option is highlighted. The main content area contains text explaining the GSA as a database of observations from the Gemini North Telescope. It mentions that users can search by object name and science program, and that the search results are in a tabular format. It also notes that the GSA Data Retrieval facility allows archive users to download archive data. A section titled "The current release to the archive." is visible. Another section discusses proprietary data access, stating that users must register with the CADC to access their data. A "What's New?" link is mentioned in the "Help" menu. The footer of the page includes a "Form Help" link for more detailed instructions on making efficient use of the query form.

OPD, SOAR, Gemini –
Brazil 2010-03-09

Future plans?

- Pending contract/budget/resources:
 - Backwards compatibility work.
 - PI packaging replacement:
 - Automatic association of calibration with science files;
 - User configurable notification;
 - File status: Downloaded, Never downloaded, Modified since last download.
 - CAOM, products and VO publication:
 - End-to-end experiment with GMOS imaging.
- Long range plan: input needed from user community – take your requests to the Gemini Science Committee!
